COVER PHOTOGRAPH
Brant Point Lighthouse
Nantucket, MA

Cover Photos By: Richard A. Cozier

Brant Point Lighthouse is a wooden structure, located on the south side of the entrance to Nantucket Harbor. Originally built in 1746, well before the United States had won its independence. Wooden lighthouses often caught fire from their oil burning lamps, and Brant Point Lighthouse was no exception – fire would destroy it multiple times.

Nantucket's residents switched from farming to whaling in the early 18th century. Known as Sherburne until 1795, Nantucket soon became one of the largest whaling ports in the Northeast. In 1724, eighty-six sperm whales were killed off the coast of Nantucket. Later, the first U.S. ship to sail into a British port would be a Nantucket whaler bearing sperm oil—the most expensive, cleanest and brightest burning oil of that time.

During a town meeting on January 24, 1746, sea captains called for the establishment of a lighthouse to protect their investments. Nantucket's location on the shipping line between the colonies' main ports coupled with its thriving whaling industry made a strong case for the light. Two hundred pounds were allocated to build the first Brant Point Lighthouse.

Twelve years later the wooden structure burned down. It was rebuilt in 1758, following town approval, but knocked over by a gale in 1774.

Another town meeting approved erecting a third light "as High as the previous one . . . at the town's expense." After captains from other ports objected to paying lighthouse dues, residents called for an Act that passed in 1774 requiring all vessels fifteen tons and over to pay six shillings the first time each year it entered or left Nantucket Harbor for the maintenance of Brant Point Lighthouse.

Between the years 1783 and 1786 the lighthouse would be destroyed by fire several more times. The town sought a different, less expensive solution -- a primitive wooden lantern, with glass windows, was hoisted between two unbraced spars, driven into the loose sand, which had grooves to steady the light. The wooden lantern produced a very dim light, often compared to a lightning bug, and hence it was called "bug light."

A storm in 1788 claimed this light, but the Commonwealth of Massachusetts soon replaced it with a small wooden tower, and this structure was ceded to the federal government in 1795.

The War of 1812 decimated Nantucket's fleet of whaling ships and left much of the population impoverished. Brant Point Light was extinguished for long periods during the war, but remained unharmed. Responding to a petition by merchants and mariners of Nantucket, Congress appropriated \$1,600 on March 3, 1825 for a new lighthouse at Brant Point described as "a house at entrance of Nantucket Harbor for the keeper, with a tower on the same for lantern." This light is on the keeper's dwelling, on Brant Point, at the entrance to Nantucket harbor.

By 1856 the lighthouse had fallen into disrepair and pleas for a new lighthouse to mark the harbor entrance (the current one was "completely rotted") were answered with the construction of a \$15,000 circular brick tower and attached dwelling that was considered one of the best stations on the Atlantic Coast. The light from the new tower's fourth-order Fresnel lens first lit up on December 10, 1856.

During the 1850s, Nantucket faced a sudden decline after the invention of kerosene cut the need for whale oil (its Canadian inventor strongly hoped for an end to killing whales), the Gold Rush lured men away, and a growing sandbar blocked the harbor. Luckily, Americans would soon begin the tradition of taking summer vacations, and the island was granted new life.

Shifting sands once again required a new lighthouse, and the present wooden tower, the ninth light to grace Brant Point, was erected at the tip of the point in 1901, roughly six hundred feet east of the 1856 lighthouse.

Brant Point's light, which shines at an elevation of just twenty-six feet making it the shortest light in New England, was changed from white to red in 1933 so that it would not be mistaken for the increasing number of house lights near the harbor. The tower was completely renovated in 1983 and again in 2000. Brant Point Light was automated in 1965, but the little conical tower with its black lantern still has many visitors, who find it an excellent spot to watch the ferries and other vessel traffic entering and leaving Nantucket Harbor.

The fourth-order Fresnel lens from Brant Point is on display at the Nantucket Life-Saving Museum.

SALES POLICY

PERKO Products are sold through our established Distributors. We do not sell direct to the public or organizations. Therefore, possession of this catalog does not infer an offer to sell. Please contact your local marine supplier or visit our website www.perko.com to find a supplier near you.

PRICES AND TERMS

Our costs can change due to causes beyond our control. Therefore, our price list is only intended for the guidance of our customers and does not necessarily establish current prices. All prices are subject to change without notice.

Orders from firms having no satisfactory history or credit rating with us must be prepaid. C.O.D. shipments will be made if a 25% deposit is sent with the order. Cash discounts do not apply to C.O.D. shipments.

DESIGNS

For the purpose of continuous improvement in our products, the designs and specifications are subject to change without notice.

RETURN GOODS

A Repackaging Service Charge of \$10.00 net will apply to all broken packages. Products made to order are not returnable. Stock products in new, saleable condition are only returnable when permission has been granted by us, and are subject to handling and repackaging charges. Return shipping charges must be prepaid. Purchase date and invoice number are required when requesting an R.G.A. (Return Goods Authorization) number. Permission must be requested within 30 days after receipt of goods.

WEIGHTS

The weights given in this catalog are approximate, but should be sufficient for general purposes.

SHIPPING INSTRUCTIONS

Customers should send specific shipping instructions; otherwise, we will use our own judgement in selecting route.

SHIPMENTS

F.O.B. our plant, Miami, Florida, unless quoted otherwise. We are not responsible for damage, loss or delay after goods are delivered to carrier. When loss or delay occurs, we will gladly assist in tracing or expediting, but such assistance is no criterion of responsibility.

When there is **loss or apparent visible damage** to a shipment when tendered for delivery, **do not** give the carrier a clear receipt. Note such damage on the carrier's delivery receipt and **have the driver sign the receipt.**

CONCEALED DAMAGE OR LOSS

1. Advise the delivering carrier in writing as soon as discovered or no more than 15 days after delivery, and request carrier to make an inspection.
2. **Retain**, for the carrier's inspection, the **container** and **all packaging** with which the damaged or lost material was packaged.
3. **Shortages** - Must be reported to us within 15 days after receipt of goods.

PERKO® LIMITED WARRANTY

PERKO, INC. (PERKO) warrants to the original consumer-purchaser that PERKO'S products will be free from defective materials or workmanship, and that the PERKOPLATE/PERKO-KOTE finish will remain corrosion-free under normal use and service, for a period as shown below from the original purchase date:

Product Class	Duration
Products installed by a manufacturer as original equipment	1 year or duration of the original equipment manufacturer's general accessory warranty up to 5 years, whichever is longer
Emissions system components installed by manufacturer as original equipment	2 Years
Commercial products (and/or products used in commercial service) and searchlights	1 Year
Products not included above and which are purchased over-the-counter at a retail dealer	5 Years

ALL IMPLIED WARRANTIES, INCLUDING MERCHANTABILITY, ARE ALSO LIMITED IN DURATION TO THE WARRANTY PERIOD FROM THE ORIGINAL PURCHASE DATE.

PERKO SHALL NOT BE LIABLE FOR LOSS OF USE OF ANY OF ITS PRODUCTS, NOR FOR OTHER INCIDENTAL OR CONSEQUENTIAL COSTS, EXPENSES, OR DAMAGES INCURRED BY THE ORIGINAL PURCHASER OR BY ANY OTHER PERSON.

SOME STATES DO NOT ALLOW LIMITATIONS ON HOW LONG AN IMPLIED WARRANTY LASTS, SO THE ABOVE LIMITATION MAY OR MAY NOT APPLY TO YOU. SOME STATES DO NOT ALLOW THE EXCLUSION OR LIMITATION OF INCIDENTAL OR CONSEQUENTIAL DAMAGES, SO THE ABOVE LIMITATION OR EXCLUSION MAY OR MAY NOT APPLY TO YOU.

This warranty is void if the product warranted has been damaged by accident or unreasonable use, neglect, improper service or other cause not arising out of defects in material or workmanship. Excluded from this warranty are electric light bulbs (lamps), sealed beam units and fuses. Specific warranty statements made on the smallest unit package, on the individual instruction/installation sheets, or on price quotations which accompany certain specialty, custom or individual products shall supersede this warranty.

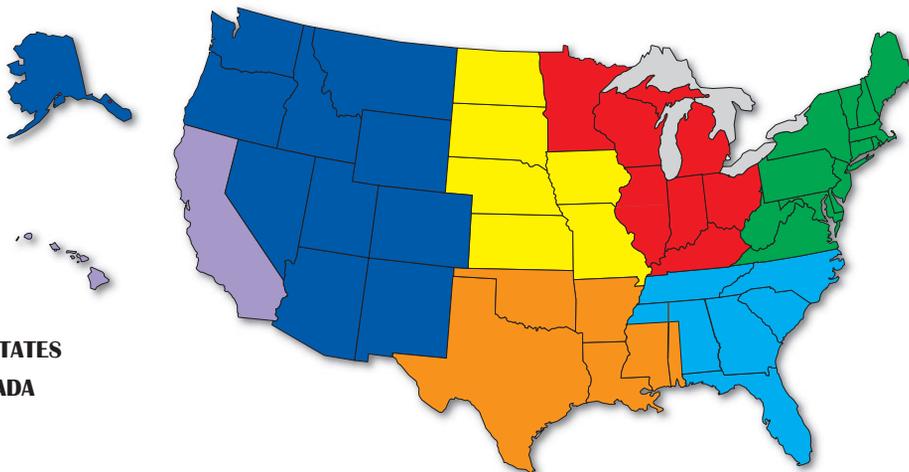

During the warranty period, your PERKO product will either be repaired or it will be replaced with a like product (at PERKO's option) without charge to the original consumer-purchaser, when returned prepaid and insured, with proof-of-purchase date to PERKO at our factory in Miami, FL. In the event of replacement, the replacement product will continue the warranty of the original product, or ninety (90) days, whichever is longer. **Important: For this Warranty to be effective, PERKO must be supplied with Proof-Of-Purchase date of the product.**

PERKO does not authorize any person or company to create for it any other obligation or liability in connection with any of its products.

Overview

With over 40 years of experience manufacturing carbon canisters in production volumes for the world's largest automotive manufacturers, Delphi developed the first carbon canister for marine use. Based on application information provided by the EPA, the NMMA and the ABYC, Delphi designed, manufactured and supplied all of the canisters used to evaluate product feasibility on boats in the summer of 2005. These canisters were used by 4 boat manufacturers to build 14 test boats and are the basis for marine industry specifications for carbon particles, vibration, strength, installation, fire resistance and sizing.

Since then, Delphi has coupled their years of automotive production experience with the knowledge gleaned through their involvement in the marine development and test program to perfect a production marine canister. Specifically designed for use on boats, Delphi marine canisters have a unique "floating" mount system which isolates them from any torque developing across mounting points by a flexing boat hull. This system permits builders to mount the canister in any position and, coupled with a special internal carbon particle support mechanism, allows Delphi canisters to easily meet all vibration requirements. Manufactured from high strength polymers and corrosion resistant materials, Delphi canisters are designed, manufactured and tested to withstand the rigors of marine applications. Delphi canisters are made and tested to automotive quality standards while being certified to meet every requirement imposed on canisters by the U.S.C.G., the EPA, CARB and the ABYC.

Canister Function and Sizing

- Polymer body with marine grade activated carbon.
- Hydrocarbon molecules are attracted to and stored on the surfaces of carbon pores by a physical phenomenon known as adsorption.
- Canister filling or adsorption occurs during two major events – thermal tank content expansion and refueling.
- Canister purging for marine industry will occur passively – based on vacuum created during cooling of gas and gas tank. Tank vacuum will pull ambient air through the canister resulting in desorption or purging of hydrocarbons from the canister.
- Purging is a function of the amount of vapor in the canister, purge air volume, and temperature.
- Optional mounting bracket allowed to rotate on end cap allows movement of mounting bracket without stressing canister body.
- For an interactive canister sizing guide please go to: www.perkofuelsystems.com/componentparts/canisters/sizing

Canister Mounting Options and Considerations

Engine Compartment Mounting

- If the canister is mounted in the engine compartment, then a heat shield is required for the canister (to pass the Coast Guard fire test). The shield comes permanently mounted to the canister.

Other Mounting Locations

- For non-engine compartment locations a heat shield is not required.

Mechanical

- Choose a canister location that protects the canister from external impacts.
- Do not mount in a location where the canister will be stepped on.
- The mounting location should be stiff, to minimize twisting/bending of the canister body.

Temperature

- The canister can withstand temperatures of 115°C continuously with 15 minute excursions to 125°C.
- A permanently mounted heat shield is available on the canister. It is for applications where the canister is mounted in the engine compartment and thus the canister must pass the Coast Guard fire test. The heat shield will also help if there is a short term temperature excursion, but is NOT effective for reducing a high continuous temperature.

Liquids

- The canister is a hydrocarbon VAPOR control device. Allowing liquid (water or gasoline) to enter into the canister will cover the carbon and prevent it from capturing the gasoline vapors. While a one time event of getting liquid into the canister will not harm the carbon, a poorly designed system will repeatedly allow liquid into the canister and prevent the canister from functioning properly. The EPA regulations require that systems be designed to prevent liquid from entering the canister.

Canister Sizing Special Applications

- To size the canister on fuel tanks with multiple vents, divide the required canister size by the number of vents.
- Example: 27 foot boat, 300 gallon fuel tank capacity, 2 vent lines on one tank. The required canister size is 4.8L if there is only one vent line. In this case, each vent line must have at least 2.4 liters of carbon. The closest size available is 3.0L.
- With large fuel tanks, canisters can be placed in series to get the appropriate carbon volume.
- Example: 27 foot boat, 300 gallon fuel tank capacity, 1 vent line. The required canister size is 4.8L. A 3.0L and a 2.0L canister can be connected in series to give the required carbon volume.

5/16" Nipple

5/8" Nipple

Location

The canister can be mounted in any location that the current vent line is located. The canister is installed between the fuel tank vent fitting and the fresh air vent fitting. The canister must be mounted above the highest point of the fuel tank. Thought must be given to the following when choosing a location:

- The hose connections to the canister must be accessible for inspection and service.
- The canister should not be mounted in a location where it will be stepped on or otherwise have a force exerted upon it.
- The canister is designed to withstand a temperature of 115°C continuously. Short term excursions (15 minutes) to 125°C is acceptable.
- The canister can be mounted in any orientation.
- If mounted in the engine compartment, the canister must have a heat shield (this is an optional component that will be integral to the canister).

System Requirements

The fuel tank vent system must be designed in such a way that liquid fuel is not passed through the vent line and into the canister. The vent system must also prevent the intake of water into the vent system and into the canister. These are requirements of the EPA regulation. When designing your fuel system, you must also consider fuel expansion and situations such as storage of the vessel with a full tank on an incline.

Mounting of the Canister

The canister (with the bracket) is designed to be mounted with four #10 screws or 3/16" bolts. This is the setup that has been validated to ABYC standards. If the end user chooses to mount the canister in some other fashion, they are responsible for the validation of the mounting. Please note that the canister has an internal plate and spring that must be able to move inside the body of the canister. For this reason, any mounting mechanism must not constrain the body for 25 mm from either end of the canister body.

Connection of the Vent Line to the Canister

The vent hose must be anchored to the boat structure within 6 inches of the canister fittings. The vent hose must be routed to prevent a load from being exerted onto the canister fittings.

The hose clamp must be a minimum of 3/8" wide. The clamp must not distort the fitting on the canister when tightened.

Canister Sizing vs Fuel Tank Size

Use the table below to determine canister size based upon length of boat and fuel tank volume.

Trailerable Under 26 Feet	
Canister (Liters)	Tank Size (Gallons)
.50	0-62
.75	63-93
1.0	94-124
1.5	125-186
2.0	187-248
3.0	249-372
4.0	373-496

Non-Trailerable Over 26 Feet	
Canister (Liters)	Tank Size (Gallons)
.50	0-124
.75	125-186
1.0	187-248
1.5	249-372
2.0	373-496
3.0	497-744
4.0	745-992

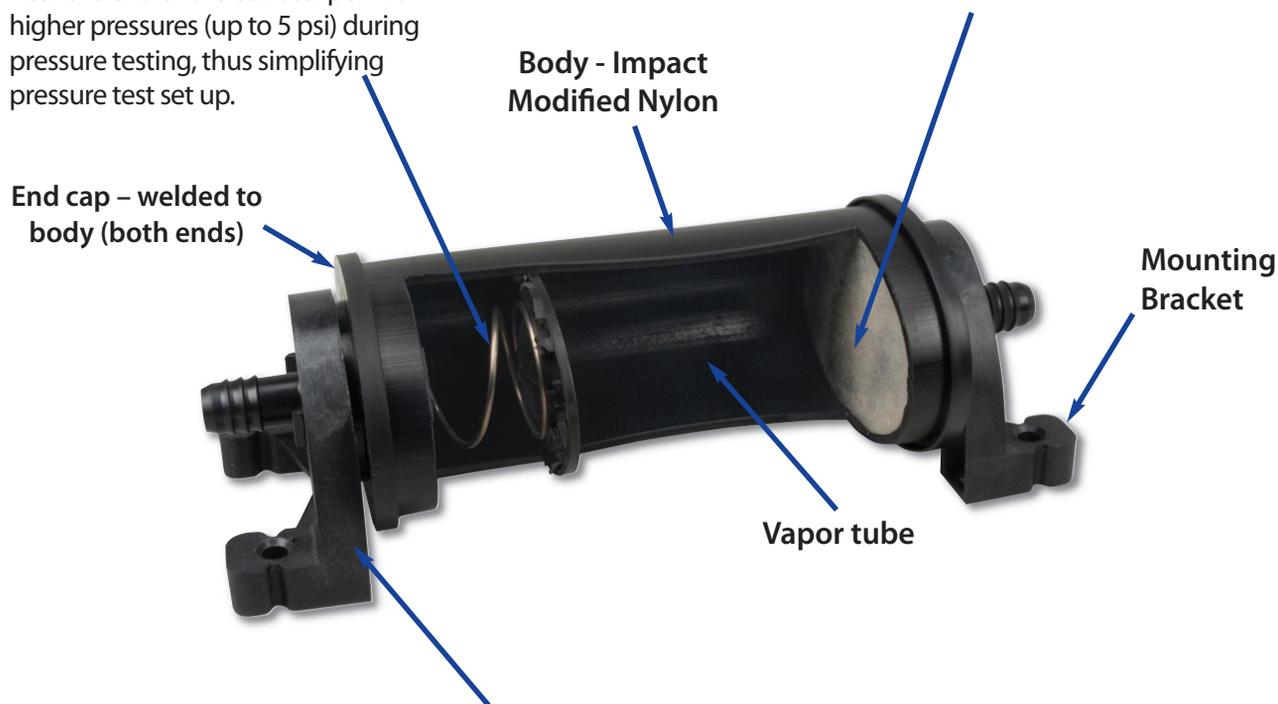

Delphi Carbon Canisters

Features & Benefits

Spring loaded volume compensator compresses carbon to reduce internal abrasion caused by vibrations. The heavy wall, elliptically shaped body and location of the volume compensator near the end of the canister permit higher pressures (up to 5 psi) during pressure testing, thus simplifying pressure test set up.

Large surface area filters located at each end of the canister keep carbon in place and allow for the lowest airflow restrictions available.

Patented "floating bracket" allows for easy installation while reducing the transmission of torque to the canister body, end caps and spuds.

The "floating bracket" also protects end caps from heat so that the factory installed heat shield is all that is needed to meet engine compartment requirements for fire protection. Builders simply install as usual with no additional effort or insulation requirements.

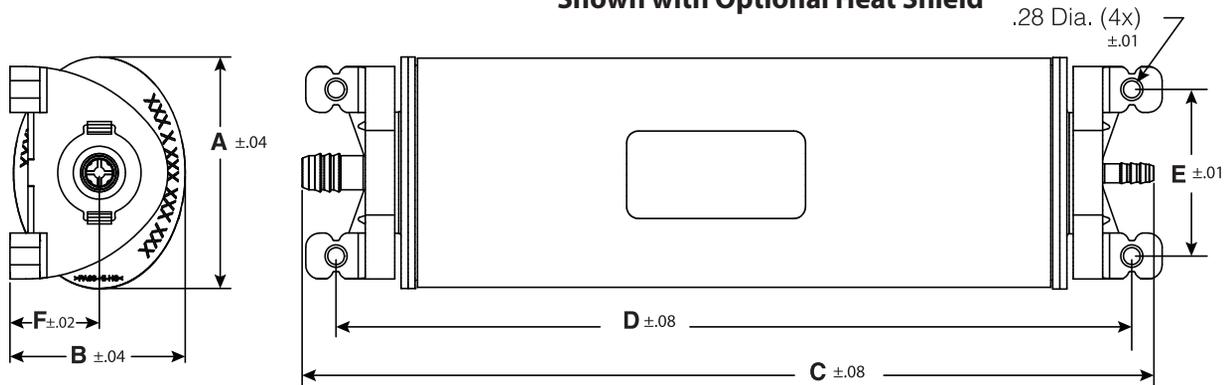

Activated Carbon
Volume varies depending on application

Delphi marine canisters are available in sizes ranging from 0.5L to 4.0L. Each size offers hose nipple connection options of 5/16" in and 5/8" out or 5/8" in and 5/8" out. The same configurations are also available with a heat shield if required.

NEW PRODUCT

Fig. 0635 Special Application Flapper Valve Fill Pipe Insert Inlet Check Valves (ICV) Patent Pending

CONSTRUCTION:

- White polymer valve with black polymer flapper
- Valves designed for use with plastic or metal tanks
- Perko's new patent pending "In-Pipe ICV" fits inside the fuel pipe itself
- In-pipe ICVs mount inside standard 1½" fill pipes near the connection to the fuel tank
- Eliminates the need to retool existing doghouse on plastic tanks
- Replaces in-line ICVs, eliminating 4 hose clamps & 2 leak points
- Allows for full 18 gpm flow rates

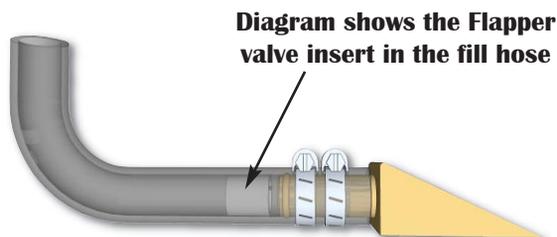

Fig. 0635

Inlet Check Valves (ICV)

- ICVs are used to help prevent wellback (the reverse flow of fuel out of the fill after refueling is completed) & spitback. These normally closed valves are opened by the presence of fuel running down the fill pipe during refueling.
- All Perko inlet check valves are designed to handle incoming fuel flows in excess of 18 gallons per minute.
- Inlet check valves can be tank mounted or inserted into the fill pipe.
- Mounting options for tank mounted ICVs include flanged (for plastic tanks), threaded or welded (for metal tanks) and swivel (for both plastic and metal tanks)
- Custom ICVs are also available for specialized applications.

Technical Information

- For use in polymer or aluminum tanks
- Hose Connection: 1-1/2"
- Maximum fuel leakage is 0.5cc/m at 12.5 & 149kPa.

Special Application Inlet Check Valves (ICV)

CONSTRUCTION:

- Machined Aluminum
- White Polymer Valve
- Valves designed for mounting on aluminum tanks
- Mounting options – Welded or 1½" NPTF Threaded
- Aluminum tank ICVs can be factory cut to 22½° or 45° angles so that tank builder can form & weld 45° and 90° elbows.

Fig. 0553 In-line Vent Hose Surge Protector

Patent Pending

CONSTRUCTION:

- Black Polymer Valve
- Aluminum Surge Float

Features:

- Prevents fuel surges and back splash during re-fueling
- Fits in 5/8" Fuel hose vent line

Perko's patent pending in-line surge protector functions both as a fill limit valve assisting in pump auto shut-off and a check valve to prevent wellback in the vent line. Consult Perko for details on how to install the surge protector as a replacement for a fill limit valve.

Note: Must be installed within 45° of vertical if vented.

Float in Static Rest Position

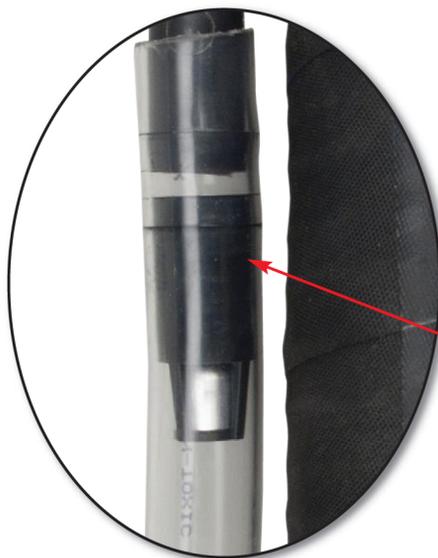

Float Rises with fuel surge

Float seals vent line preventing wellback

Fig. 0553

Diagram illustrates placement of surge protector in the vent line.

Fill Limit Valves (FLV)

- FLVs are used to establish ullage (airspace) in the tank and help prevent overfilling.
- Perko FLVs connect to 5/8" hose. They are designed to vent to vented fuel fills and not directly to canisters.
- Mounting options for tank mounted FLV's include flanged (for plastic tanks), threaded, welded and swivel (for metal tanks).
- Swivel valves include valve, valve housing, o-ring, snap ring and tank insert.
- Distant sensing (DFLV) versions are available for both plastic and metal tanks on a custom basis.
- Custom ullage set points are available. Contact the factory for details.

Technical Information

- For use on plastic or aluminum tanks
- Hose Connection - 5/8"
- Flow > 70 l/min @ 0.25 kPa.
- Flow without corking > 130 l/min.
- Minimum reopening pressure: 0.5 kPa

For Aluminum Tanks

Special Manifold

Tank Vent Valves (TVV) (ROV+OPR)

- Tank vent valves are designed to direct vapors generated during the diurnal cycle. Vent lines from TVV's generally run to carbon canisters. Properly installed, TVV's help protect canisters from liquid fuel.
- Perko TVV's are sometimes referred to as rollover valves (since they offer rollover protection) and as grade vent valves. They also include an overpressure relief feature.
- Mounting options for tank mounted TVV's include flanged (for plastic tanks), threaded (for metal tanks) and swivel (for both plastic and metal tanks).
- Internally mounted versions are available for both plastic and metal tanks on a custom basis.

4

Technical Information (ROV+OPR)

- For use in Plastic or aluminum tanks
- Hose Connection: 5/16"
- Vent orifice: 0.091 inch (~2.32mm)
- Air Flow Rate Positive Pressure @ 0°: 3.5 kPa ≥ 10 l/min & 10 kPa ≥ 18.2 l/min
- Air Flow Rate Positive Pressure @ 180°: 7 kPa ≤ 0.2 l/min, 13 kPa > 1 l/min
- Reopening Pressure > Min 7 kPa
- Maximum fuel leakage is less than 1.5 cc/min 6 kPa

Fig 0488 - Air-Fuel Separator

CONSTRUCTION:

- Black Polymer

5

- Air Fuel (A/F) separators are designed to protect canisters from liquid fuel. Vapors pass through the device to the canister while liquids are returned to the fuel tank.
- Perko A/F separators mount using the same “floating bracket” system used on Perko/Delphi carbon canisters.
- A 0588 series TVV is mounted inside each Perko A/F separator giving it rollover protection, overpressure relief and the restriction needed to aid in automatic pump shutoff.
- Heat shields are available for use in engine compartment installations.
- Properly installed, A/F separators can replace tank vent valves, eliminating the need to provide access to distant parts of the fuel tank.

Air-Fuel Separator Access Issues

Perko's Air Fuel Separator helps solve difficult access problems. Running internal vent lines (in either plastic or aluminum tanks) and replacing the tank vent valves with an Air fuel separator eliminates the need to provide access to distant corners of the tank.

5

Air-Fuel Separator Positioning

Perko's Air Fuel separator must be positioned horizontally above the highest level that fuel in the tank can reach during full tilt or storage. The further away from the port/starboard centerline of the tank that the Air fuel separator is located, the higher it must be positioned above the tank

Fig. 0630 P-Trap Vent Valve (PTW)

CONSTRUCTION:

- Stainless steel escutcheons, aluminum shaft & polymer body and splash guard
- Allows vapor to vent from tank during thermal expansion of fuel and while refueling
- Allows fresh airflow into the tank during thermal contraction of fuel and when engine is running
- Protects canisters and fuel systems from water
- Deflector style vent opening reduces water volume entering assembly
- Internal P-Trap and check valve prevents water from passing through assembly into fuel system
- Straight hose connection
- Black or white polymer splash guard

Fig. 0540DPR

Fig. 0540 Ring - Spare Mounting Ring

CONSTRUCTION:

Installation Note: on the use of Vented Fuel Fills • Black Polymer
PERKO® Fig. Nos. 0540, 0541, 0542, 0543, 0580, 0581, 0582, 0583, 0590, 0591, 0640, 0641, 0642, 0643, 0680, 0681, 0682, 0683, 0690 & 0691

The use of these heightening rings is required in any application where water might be splashed around a vented fill. The ring raises the opening between the fuel cap and fill an additional 3/8" above the deck surface, thereby reducing the likelihood that splashed water will enter the fuel system through the breathing vent. The split version of the ring is designed for aftermarket use on existing installations. In most cases, it allows the ring to be added without disconnecting fuel and vent hoses from the fill. For new OEM installations, rings are supplied without the split since they can be installed before hoses are connected to the fill.

NOTE: The ring will not prevent water from entering the system if the cap becomes submerged or substantially flooded. If this situation exists, the fill/vent must be moved to a dry location or replaced with a sealed cap and a separate vent located elsewhere.

A large, white, rectangular sign is mounted on a metal post. The sign features the word "PERKO" in a large, bold, blue, sans-serif font. Below the word is a stylized blue and white graphic consisting of two thick, curved lines that resemble a wave or a stylized "P" shape. The sign is set against a background of a grassy area and a building in the distance.
